

Homework

Introduction to Biological Network Visualization (Due 5/12/2016)

Part 1: Creating custom visualization for public data sets

1. Import known interactions from public database

PPARG
TCF7L2
RETN
IRS1
HNF1A
HNF4A
KCNJ11
GCK
LIPC
PTPN1
ABCC8
ENPP1
HNF1B
HMGA1
AKT2
WFS1
IRS2
SLC30A8
PDX1
MTNR1B
IGF2BP2
CDKAL1
SLC2A2
NEUROD1
PAX4
MAPK8IP1
GCGR
GPD2

- Choose **File—> Import —> Network—> Public databases...**
- Copy & paste the gene list above to the search box
- Click **Search**

Import Network from Public Databases

Data Source: Universal Interaction Database Client About

1. Enter Search Conditions

Search Mode: Search by ID (gene/protein/compound ID)

NEUROD1
PAX4
MAPK8IP1
GCCR

Search

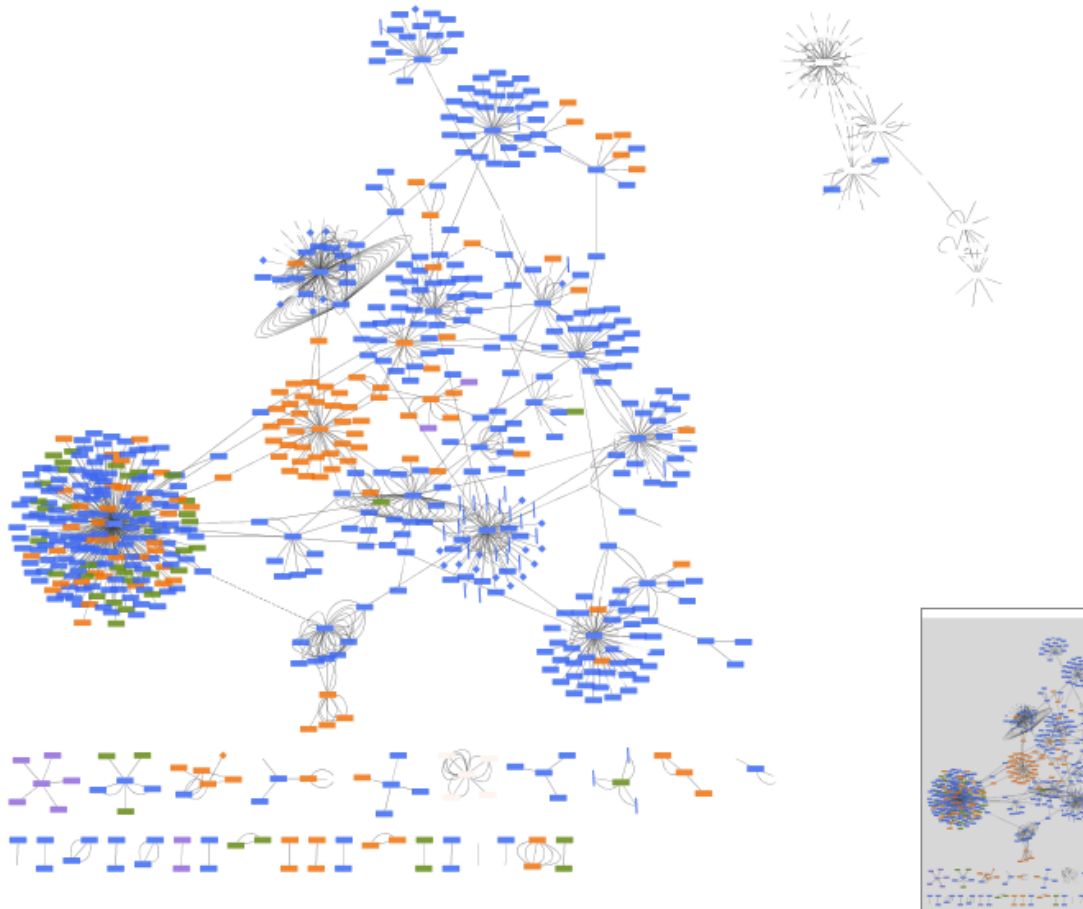

2. Select Databases

Import	Stat...	Database Name	Records Found	Database Type (Tags)
<input type="checkbox"/>	Active	GeneMANIA	4235	protein-protein, predicted, imported
<input type="checkbox"/>	Active	mentha	2703	protein-protein, imported, clustered, spoke e
<input type="checkbox"/>	Active	BioGrid	1650	protein-protein, internally-curated, rapid cur
<input checked="" type="checkbox"/>	Active	IntAct	1166	protein-protein, smallmolecule-protein, nucl
<input type="checkbox"/>	Active	Reactome-Fls	981	protein-protein, predicted, imported, cluster
<input type="checkbox"/>	Active	MINT	613	protein-protein, internally-curated, imex cur

Select All Select None ☐ Automatic Network Merge

Cancel Import

- From the result, choose *IntAct*
- Click **Import**
- It will take some time to import the data from the server in UK...
- You will get the network like the following:

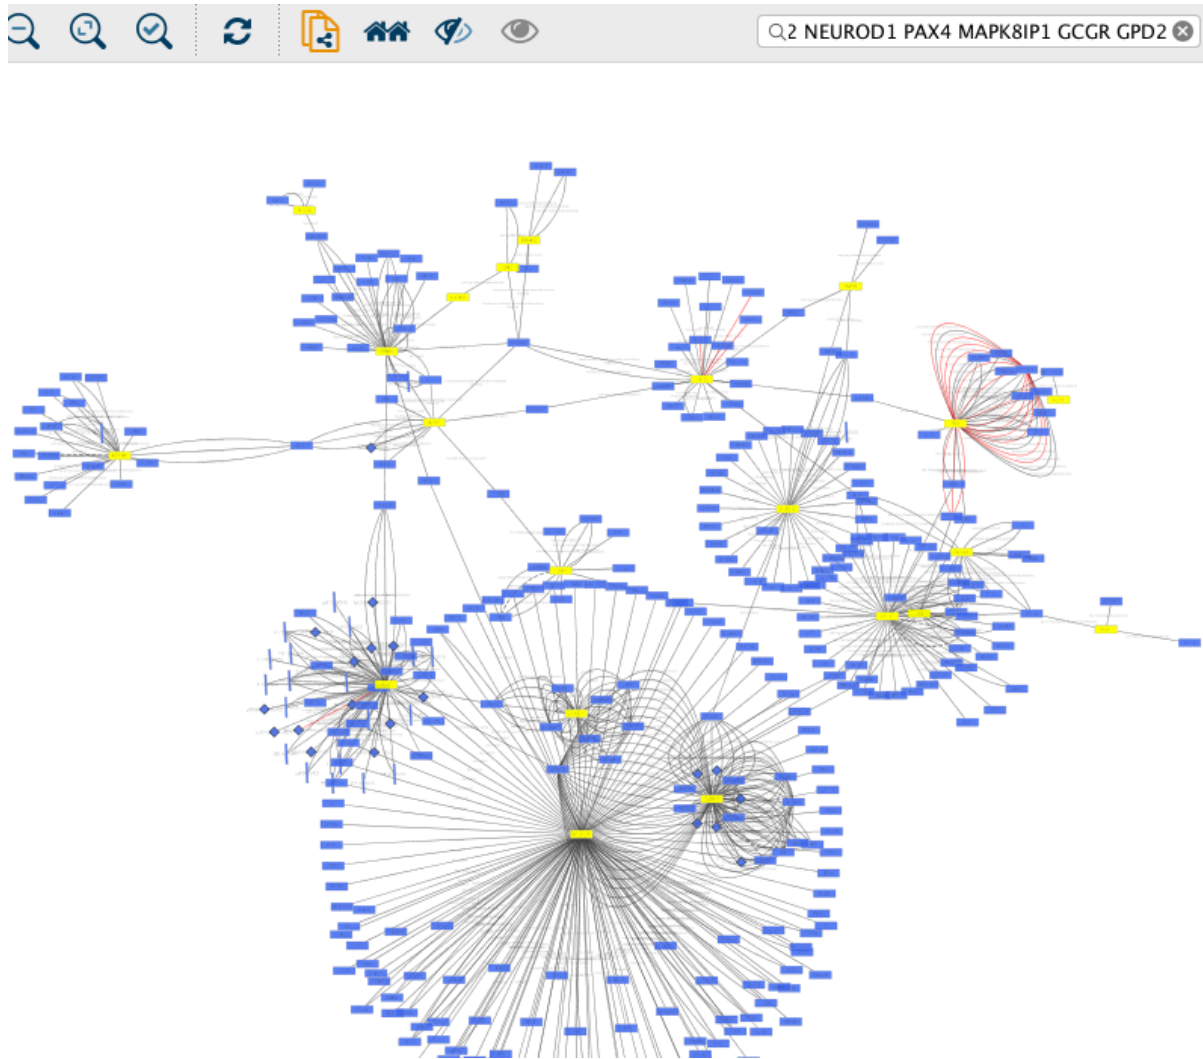

2. Filtering and Subnetworks

- Click Select tab
- Create a new Filter:
 - Click + and create new Column Filter
 - Select *Node: Taxonomy Name*
 - Enter *human* as query
- From the selection, create a new subnetwork: **File—>New—> From Selected nodes, all edges**
- Apply yFiles organic layout: **Layout —> yFiles Layouts —> Organic**

3. Creating new data column for nodes

- Copy the original gene list
- Paste the list to the search box and press enter
- Now all of the genes in the original query are highlighted:

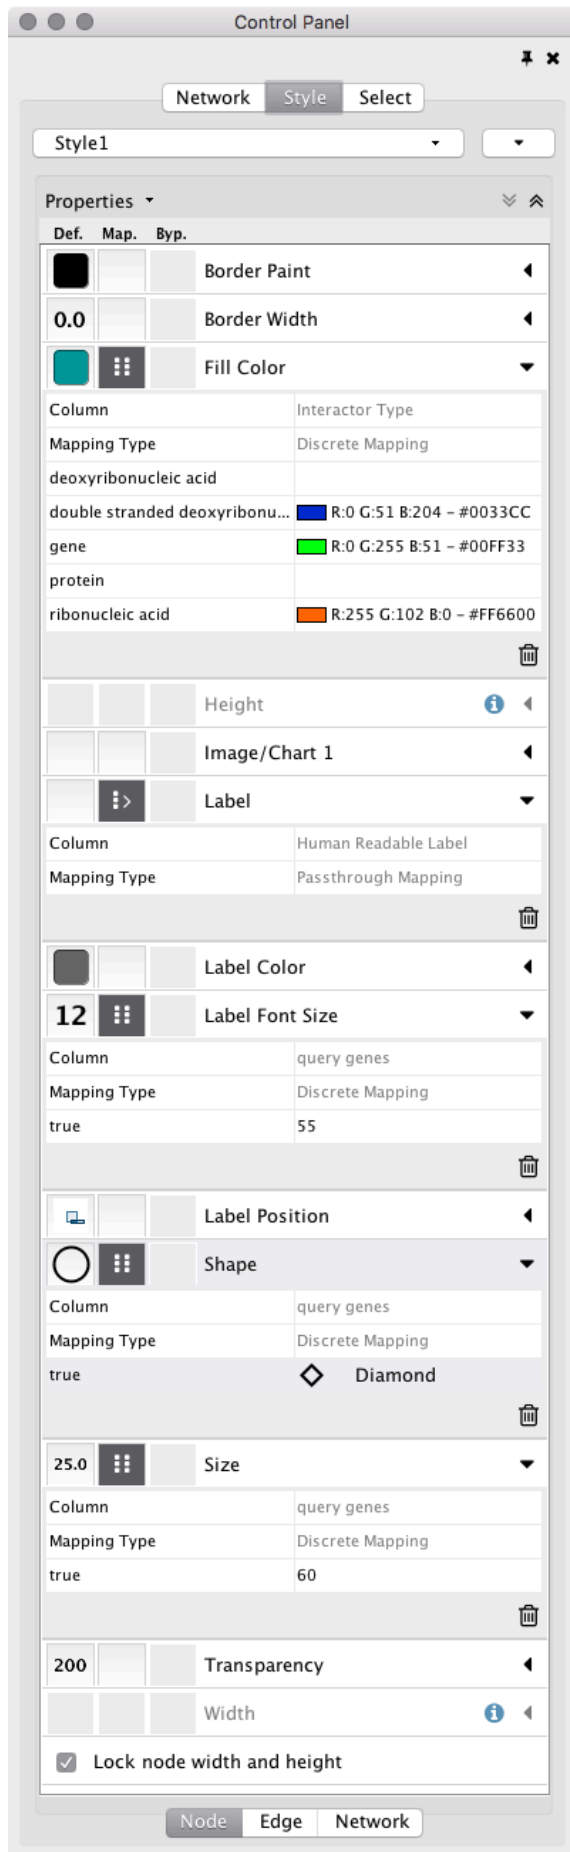

- Click + icon on the Table Panel
- Create new **Single Boolean Column**
- Name it ***query genes***
- Click any of the cell under the query genes column in the table browser
- Type true and press enter
- Right-click the cell
- Select ***Apply to selected nodes***

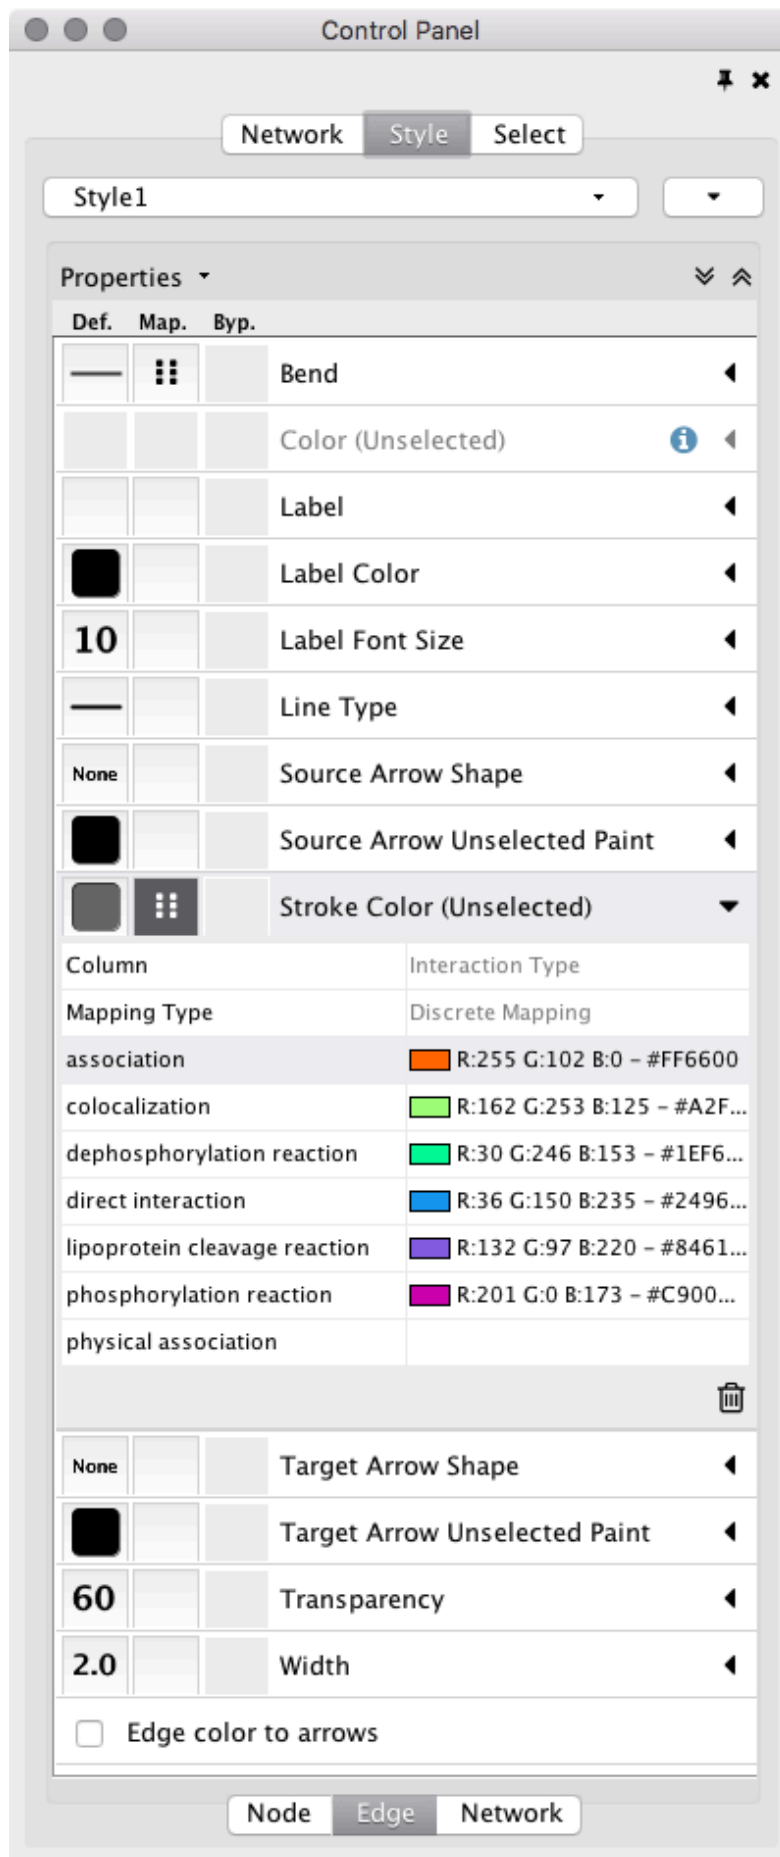

Now all of the genes in the original query list have special property “query genes” and you can use this for custom visualization.

4. Creating Visual Style

- Apply edge bundling: Layout—>Bundle Edges —> All nodes and edges
- Click Style tab
- Create new visual Style by clicking the triangle icon next to current style name
- Create your custom Visual Style: Use the following as a template but be creative!

I'll show the result of this mappings in the 2nd lecture.

Part 2: Setup Python and Jupyter Notebook

We will use Jupyter Notebook and Python to control Cytoscape in the next lecture. Please make sure you can use them on your machine.

- Read and follow this instruction: <https://github.com/idekerlab/tsri-lecture/blob/master/documents/Setup%20Guide.pdf>
- Start Cytoscape
- Start Jupyter Notebook
- Create a new Python 3 notebook
- Copy & Paste the following code to the cell and run:

```
from py2cytoscape.data.cyrest_client import CyRestClient
from IPython.display import Image
```

```
cy = CyRestClient()
yeast_net = cy.network.create_from('http://
chianti.ucsd.edu/~kono/data/galFiltered.sif')
net_svg = yeast_net.get_png()
```

```
Image(net_svg)
```

If you can see the image like the following, you are ready to use Cytoscape via REST API!

```
In [13]: from py2cytoscape.data.cyrest_client import CyRestClient
from IPython.display import Image

cy = CyRestClient()
yeast_net = cy.network.create_from('http://chianti.ucsd.edu/~kono/data/galFiltered.sif')
net_svg = yeast_net.get_png()

Image(net_svg)
```

Out[13]:
